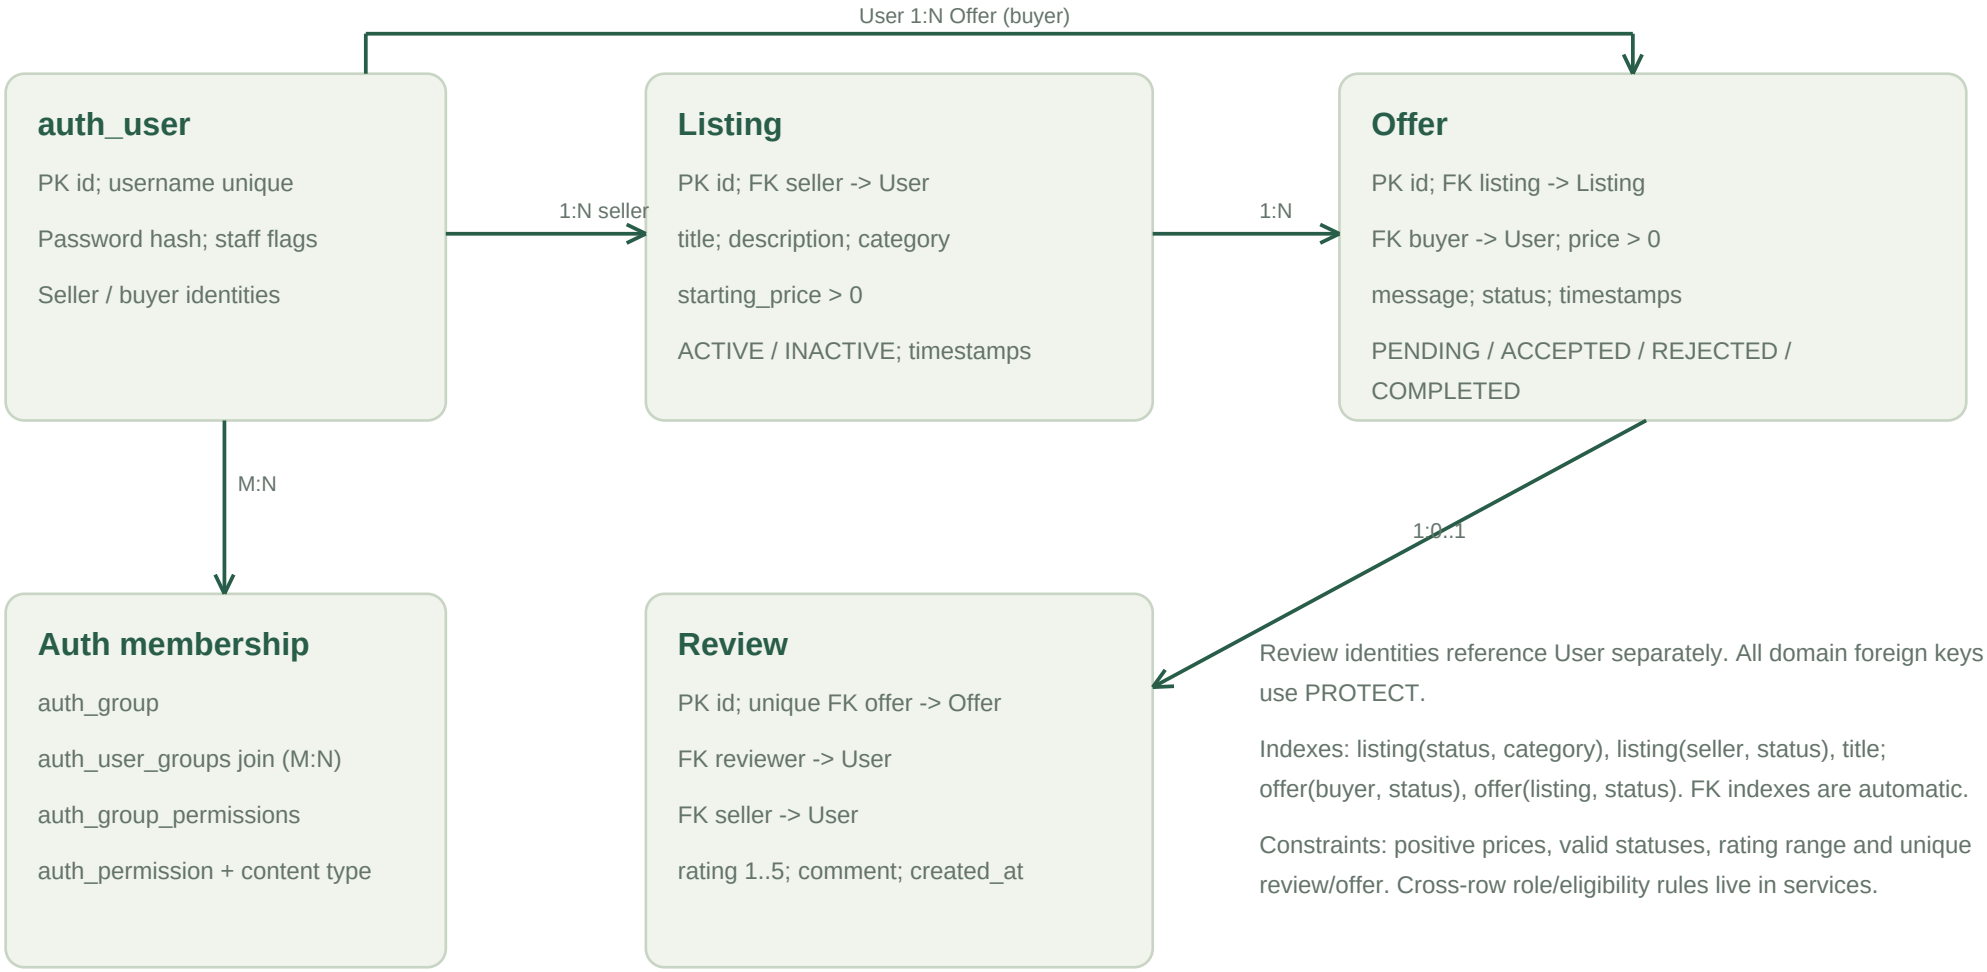
Database relationships

Built-in Django User and Group plus three marketplace models



Review identities reference User separately. All domain foreign keys use PROTECT.

Indexes: listing(status, category), listing(seller, status), title; offer(buyer, status), offer(listing, status). FK indexes are automatic.

Constraints: positive prices, valid statuses, rating range and unique review/offer. Cross-row role/eligibility rules live in services.

The B-tree title index does not optimize arbitrary substring search. Add PostgreSQL trigram indexes only after measuring the workload.
