# SkillMarket | System architecture

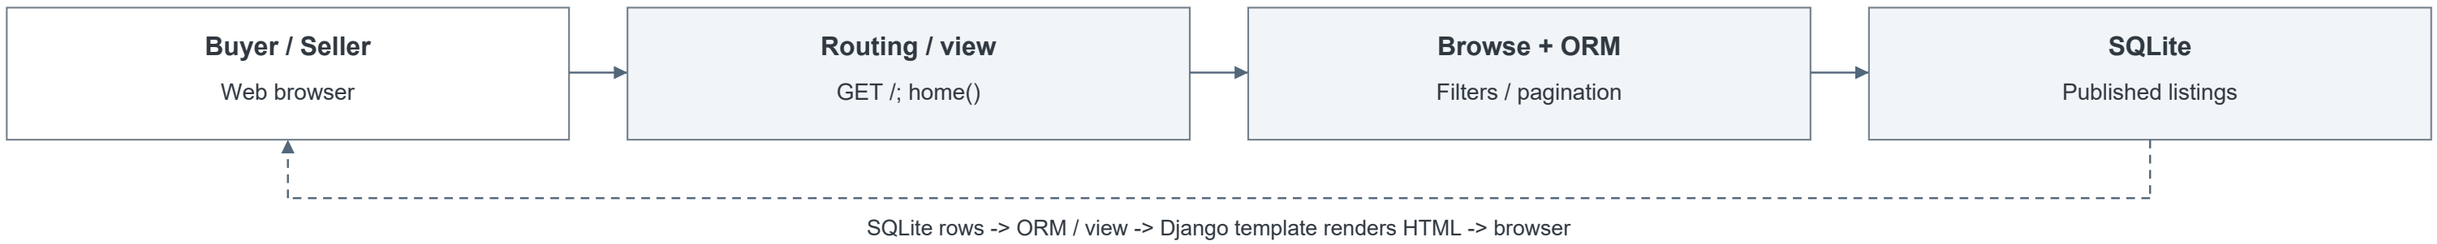

# SkillMarket | Request and response flows

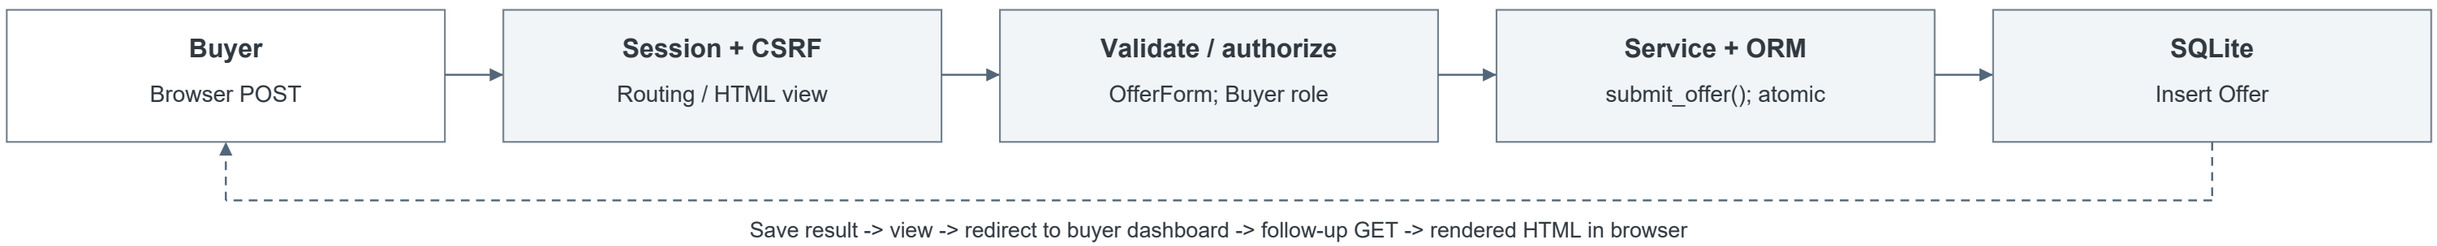

All application boxes execute in the same local Django process. SQLite is a file on that machine.

## A | Browse listings

Public discovery needs no login. home() calls services.browse(), annotates ratings and renders home.html.

## B | Submit an offer

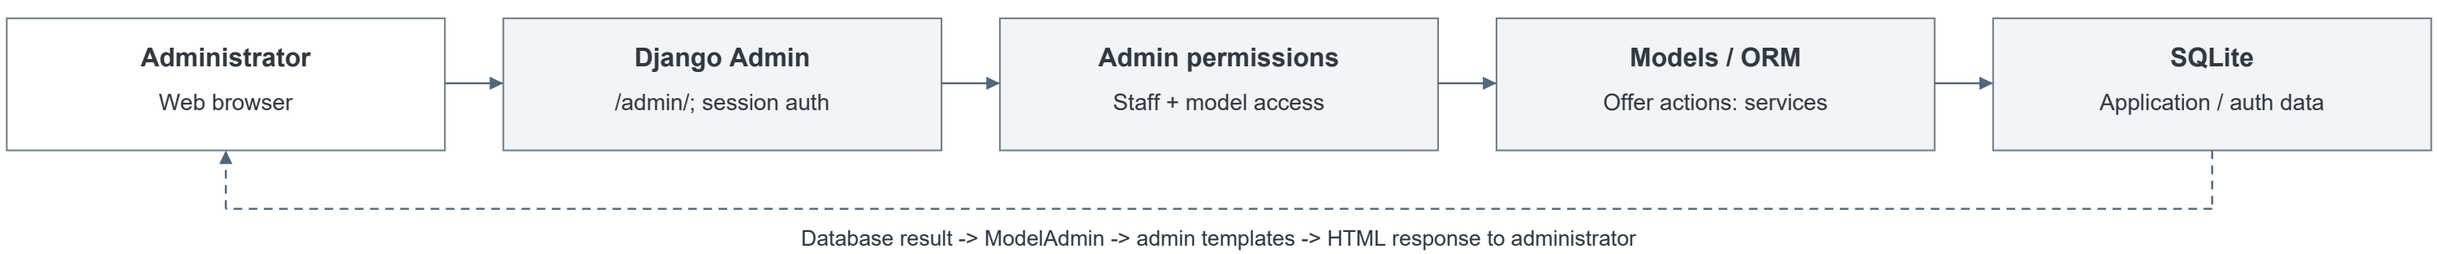

Requires an active listing owned by another seller. Model validation runs before saving; invalid requests return errors.

## C | REST API request

Public listing reads allow anonymous clients. Protected requests enforce roles/ownership; reads may query the ORM directly.

## D | Administration

Listings and reviews use ModelAdmin; offer status actions use services.transition(). Admin pages render HTML.
